

# AQA C1a Atomic structure and the periodic table

## COMBINED FOUNDATION

Atoms, elements and compounds

<b>Atom</b>	The smallest part of an element that can exist	Have a radius of around 0.1 nanometres and have no charge (0).
<b>Element</b>	Contains only one type of atom	Around 100 different elements each one is represented by a symbol e.g. O, Na, Br.
<b>Compound</b>	Two or more elements chemically combined	Compounds can only be separated into elements by chemical reactions.

<b>Central nucleus</b>	Contains protons and neutrons
<b>Electron shells</b>	Contains electrons

Sub atomic particles

Name of Particle	Relative Charge	Relative Mass
Proton	+1	1
Neutron	0	1
Electron	-1	Very small

7  
Li  
3

<b>Mass number</b>	The sum of the protons and neutrons in the nucleus.	
<b>Atomic number</b>	The number of protons in the atom	Number of electrons = number of protons

<b>Mixtures</b>	Two or more elements or compounds not chemically combined together	Can be separated by physical processes.
-----------------	--------------------------------------------------------------------	-----------------------------------------

Method	Description	Example
<b>Filtration</b>	Separating an insoluble solid from a liquid	To get sand from a mixture of sand, salt and water.
<b>Crystallisation</b>	To separate a solid from a solution	To obtain pure crystals of sodium chloride from salt water.
<b>Simple distillation</b>	To separate a solvent from a solution	To get pure water from salt water.
<b>Fractional distillation</b>	Separating a mixture of liquids each with different boiling points	To separate the different compounds in crude oil.
<b>Chromatography</b>	Separating substances that move at different rates through a medium	To separate out the dyes in food colouring.

### The development of the model of the atom

<b>Pre 1900</b>		Tiny solid spheres that could not be divided	Before the discovery of the electron, John Dalton said these solid sphere made up the different elements.
<b>1897 'plum pudding'</b>		A ball of positive charge with negative electrons embedded in it	JJ Thompson's experiments showed that an atom must contain small negative charges (discovery of electrons).
<b>1909 nuclear model</b>		Positively charged nucleus at the centre surrounded by negative electrons	Ernest Rutherford's alpha particle scattering experiment showed that the mass of an atom was concentrated at its centre.
<b>1913 Bohr model</b>		Electrons orbit the nucleus at specific distances	Niels Bohr proposed that electrons orbited in fixed shells; this was supported by experimental observations.

<b>James Chadwick</b>	Provided the evidence to show the existence of neutrons within the nucleus
-----------------------	----------------------------------------------------------------------------

<b>Electronic structures</b>	<b>Electron shell</b>	<b>How many electrons?</b>
	<b>1</b>	2
	<b>2</b>	8
	<b>3</b>	8
	<b>4</b>	18

**Rutherford's scattering experiment**

A beam of alpha particles are directed at a very thin gold foil

Most of the alpha particles passed right through. A few (+) alpha particles were deflected by the positive nucleus. A tiny number of particles reflected back from the nucleus.

<b>Chemical equations</b>	These show how chemical reactions change reactants into products. An energy change usually happens too.	Law of conservation of mass states the total mass of products must equal the total mass of reactants.
<b>Word equations</b>	Uses words to show reaction: <b>reactants → products</b> magnesium + oxygen → magnesium oxide	Does not show what is happening to the atoms or the number of atoms.
<b>Symbol equations</b>	Uses symbols to show reaction <b>reactants → products</b> $2Mg + O_2 \rightarrow 2MgO$	Shows the number of atoms and molecules in the reaction. These need to be balanced.

<b>Relative atomic mass</b>	<b>Isotopes</b>	Atoms of the same element with the same number of protons and different numbers of neutrons	$^{35}\text{Cl}$ (75%) and $^{37}\text{Cl}$ (25%) Relative atomic mass = (% isotope 1 x mass isotope 1) + (% isotope 2 x mass isotope 2) ÷ 100 e.g. (25 x 37) + (75x 35) ÷ 100 = 35.5
-----------------------------	-----------------	---------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------
